## Why Bats??

Bats save US agriculture at least \$3.7 billion per year in reduced chemical pest control. That means bats save farmers, on average, \$74 per acre.

**A mother bat eats her own body weight in insects every night. Male and juvenile bats eat about 1/2 their body weight every night.**

Many of the insects bats eat are crop or forest pests, including stink bugs, leaf miners, cucumber beetles, boll weevils, corn cutworms, and thousands more.

**White-nose syndrome, a fungal disease, is killing our bats by the millions. Bat-friendly growers help bats by maintaining safe habitat for surviving bats.**

---

The Bat-Friendly certification program is sponsored by The Save Lucy Campaign, a non-profit organization dedicated to raising awareness of North American bat conservation through collaboration and education. Our bat-friendly logo was designed by a middle-school artist as part of a community service project. For more information, or to become bat-friendly certified, please visit us at [www.saveLucytheBat.org](http://www.saveLucytheBat.org)
